Explain args and *kwrgs with example

arguments in python: *the aruments is the information which passed as a function in arguments *The arguments are specified after the function which which written inside the parenthesis we can write as amny arguments but we want to separate them from comma(,) the following example is about to print the first name which we will define the function as any class the after we call the function of that class and print out all first name

```
In [24]:
         #exp 1:to print the first name
         def my_name(fname):
             print(fname + " jadhav", )
         my name("Shubham")
         my_name("Omkar")
         my name("Vijay")
         my_name("Akshay")
         my_name("Chetna")
         Shubham jadhav
         Omkar jadhav
         Vijay jadhav
         Akshay jadhav
         Chetna jadhav
In [36]: def my name(fname,lname):
             print(fname + " ", lname )
         my_name("shubham","jadhav")
         my_name("vijay","bhaskar")
         my_name("akash","kaskar")
         my_name("lokesh","ajkar")
         my name("jayant","belekar")
         shubham jadhav
         vijay
                bhaskar
         akash kaskar
         lokesh ajkar
         jayant belekar
 In [ ]:
```
